

Cyberinfrastructure to Support Large Scale Collaborative Water Research

Jeffery S. Horsburgh

Amber Jones, Juan Caraballo

USU Spring Runoff Conference
4-10-2013

Support:
EPS 1208732

innovative Urban Transitions and Aridregion Hydro-sustainability (**iUTAH**)

- Statewide effort
- \$20 million competitive award from NSF EPSCoR
- Research capacity building
- Interdisciplinary and multi-institution
- Focused on sustainable management of Utah's water resources

Support:
EPS 1208732

iUTAH Research Focus Areas

1. Eco-hydrology

- Expand Utah's capacity in the natural sciences through instrumentation of 3 watersheds

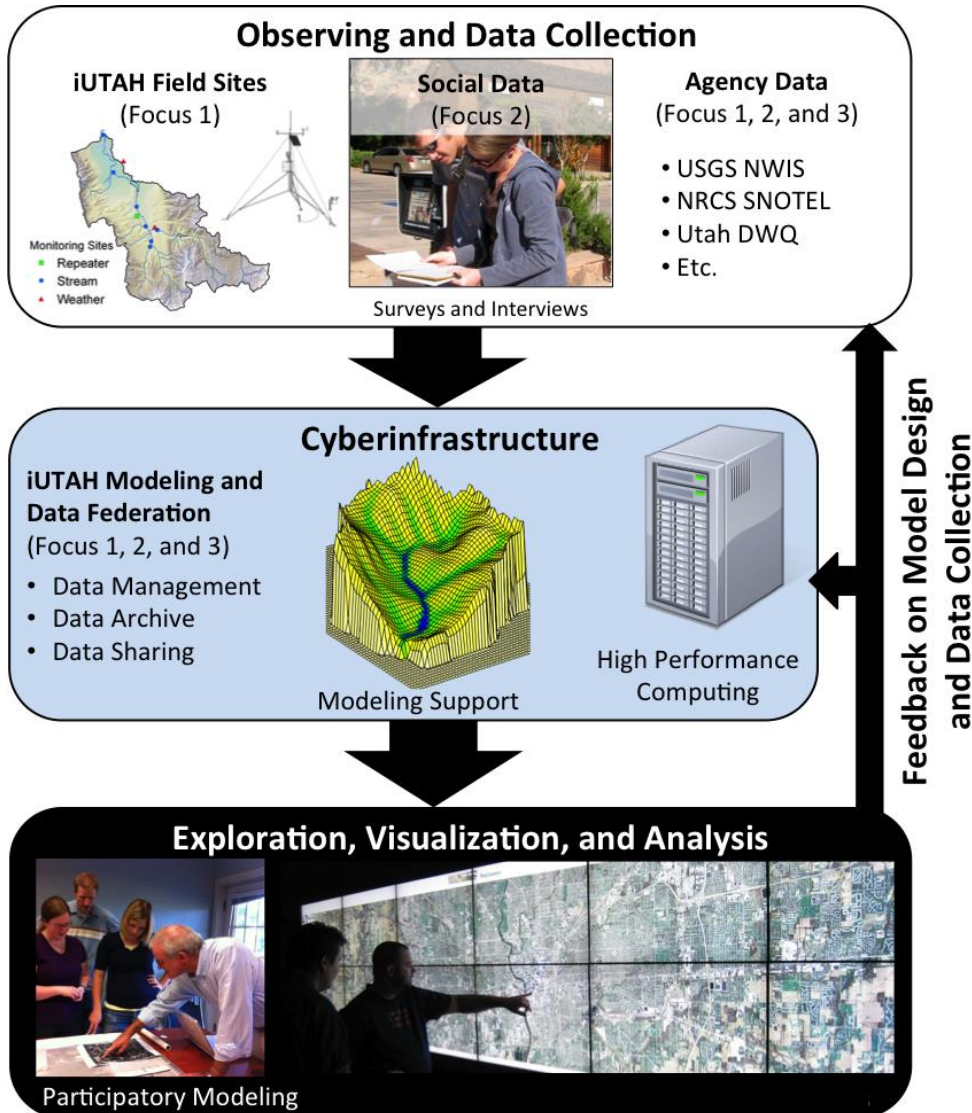

2. Social and Engineered Water Systems

- Studying demographic characteristics, water use behaviors, water infrastructure, and other measures of urban form

3. Interdisciplinary Modeling and Visualization

- Development of interdisciplinary models of socio-eco-hydrological systems to determine how changes in water availability and use alter water quantity and quality

iUTAH MDF – Information Flow

- Field sites and other data (e.g., agencies)
- iUTAH Modeling and Data Federation
- Modeling, visualization, and analysis

iUTAH MDF Focus Areas

1. Data management support for data from iUTAH facilities
 - GAMUT – Gradients Along Mountain to Urban Transitions
 - GIRF – Green Infrastructure Research Facility
2. Support for data discovery and access
 - iUTAH facility and investigator data
 - Agency data
 - National data networks
3. Support for integrated modeling
4. Data/model/resource sharing and collaboration

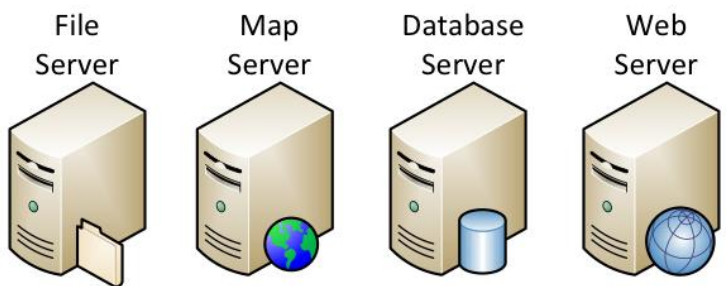

How can we create a hardware platform that supports the diverse cyberinfrastructure needs of iUTAH?

Required Functionality

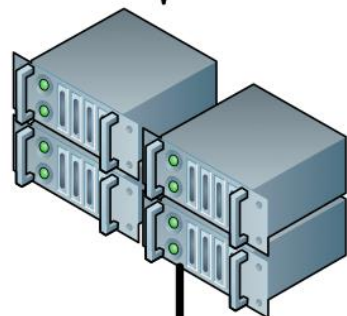

- Research platform
 - Development, prototyping, and testing of servers, software applications, and services on multiple platforms (e.g., Windows, Linux)
 - Host machines allocated for modeling, analysis, and computational tasks
- Production data service and application hosting platform
 - Web servers
 - Data web services
 - Web applications
 - Database servers
 - Map servers
 - File servers
 - Data harvesters and automated data processing applications

Hardware

VMWare Virtual Machines

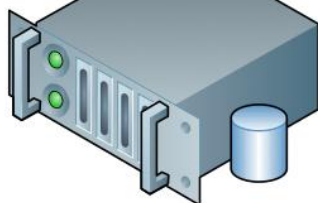

Required servers and software stacks implemented on virtual machines

VMWare
Virtual
Hosts

Many virtual machines can be hosted on a single virtual host server

Tiered
Storage

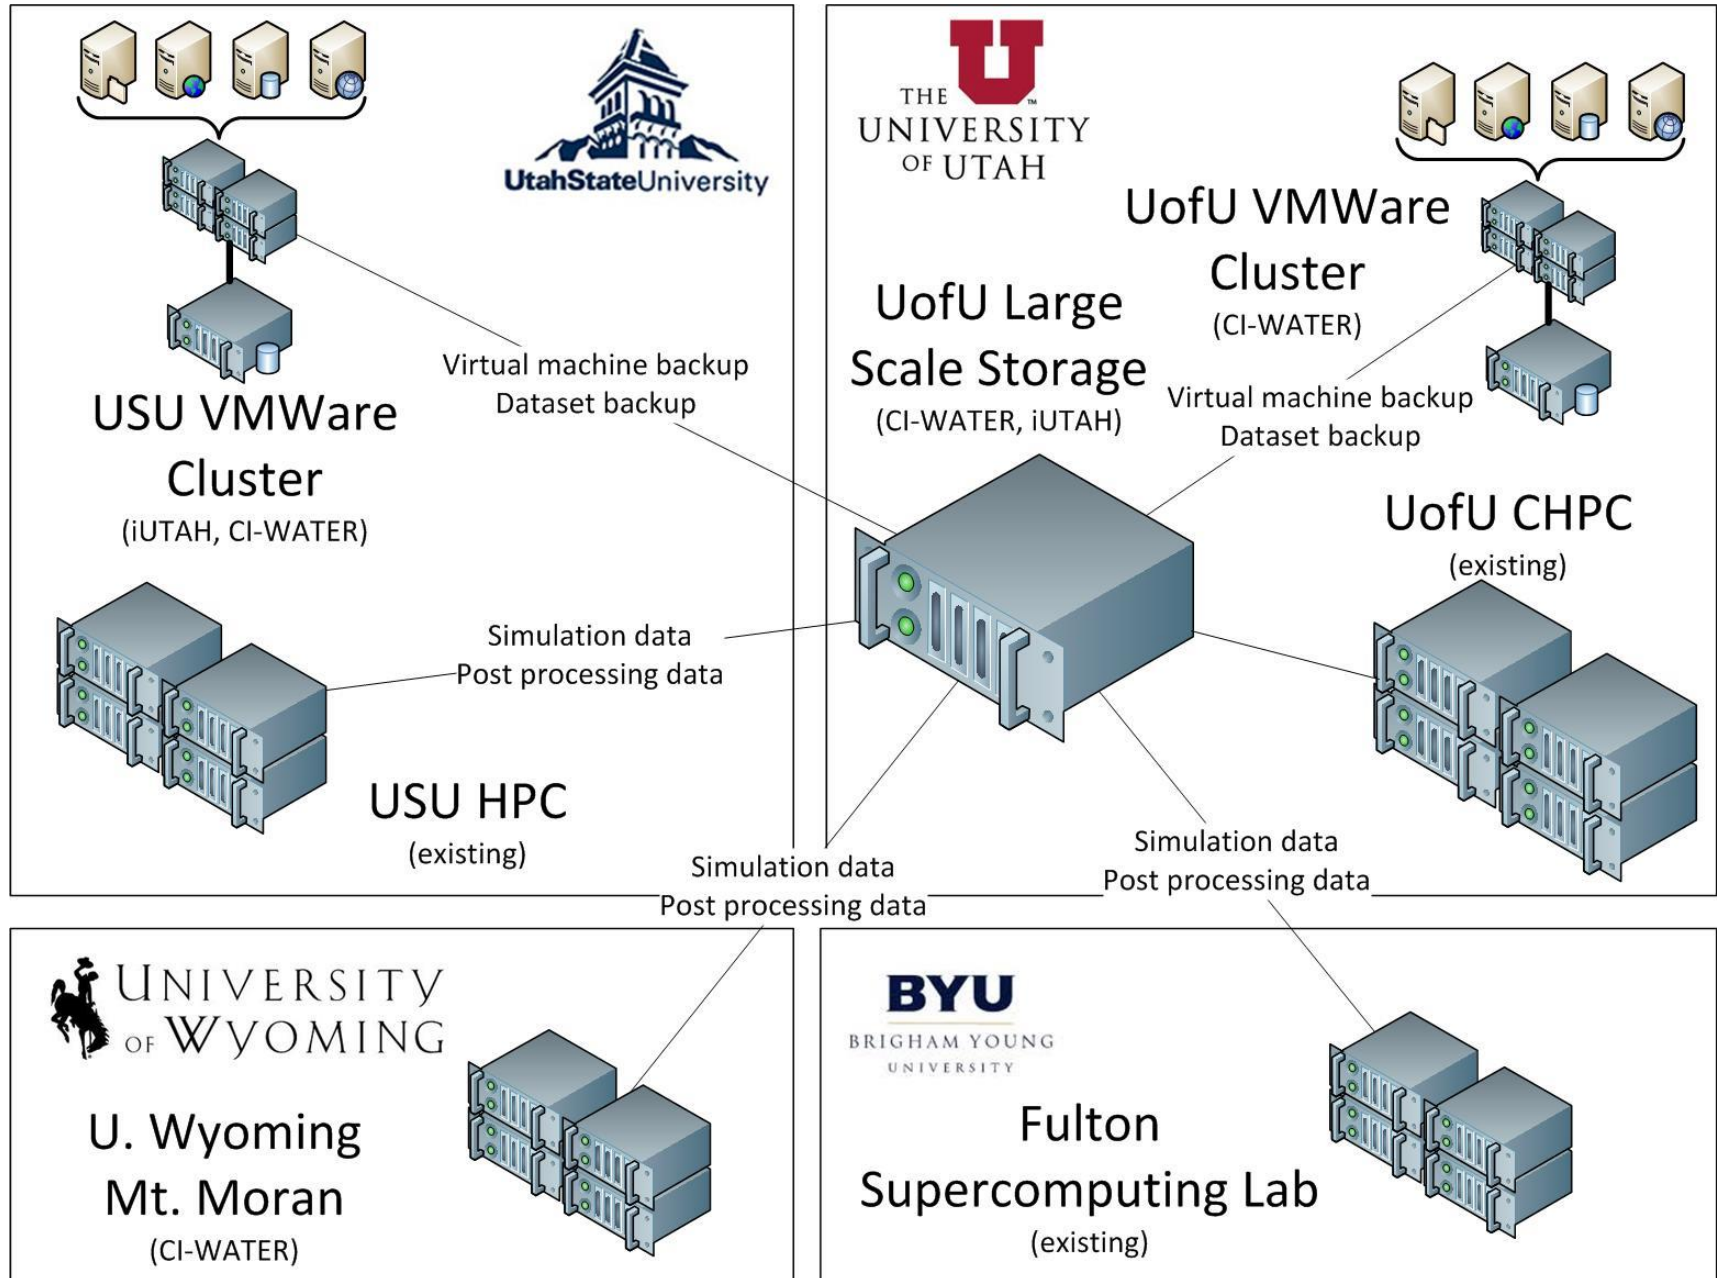

Tiered storage

Tier 1 and 2: Databases and operating systems
Tier 3: Lower demand file storage and access

Hardware Capabilities

- Quickly spin up virtual machines that implement different operating systems and platforms (e.g., Windows, Linux)
- Use shared computational and storage resources rather than requiring a physical machine for each purpose
- Create and manage both development and production servers using shared hardware
- Hot-swap virtual machines across physical host machines using virtualization software
 - Ensure failover for production virtual servers
 - Efficiently allocate resources to multiple machines

The Larger Utah EPSCoR Cyberinfrastructure Picture

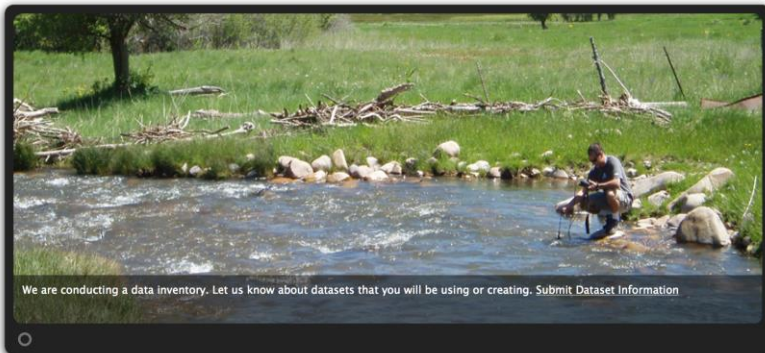

How can we enable and increase collaborative research and sharing of data and models through the innovative use of cyberinfrastructure?

iUTAH Modeling and Data Federation

data.iutahepscor.org

[Home](#) [Development](#) [Group Discussions](#) [Inventories](#) [Contact Us](#) [About Us](#)

The iUTAH Modeling and Data Federation is an online system for sharing data, models, and other digital resources. Activities of the iUTAH Cyberinfrastructure Team (CI Team) are focused on developing hardware and software systems and tools that improve iUTAH participants' capacity for data collection, organization, management, sharing, synthesis to higher-level products, and integration with models.

Announcements

Data Inventory: As an initial step in developing the iUTAH Modeling and Data Federation, we are conducting a survey of existing and planned datasets.

[Click here](#) to submit dataset information to the iUTAH data inventory or view the list of datasets that have been submitted.

Model Inventory: We are collecting information about models from a variety of disciplines that may be of interest to your iUTAH-related research. [Click here](#) to submit model information to the iUTAH data inventory or view the list of models that have been submitted.

Software Development

UTAH Modeling and Data Federation

The beginnings of the iUTAH Modeling and Data Federation have been implemented at <http://data.iutahepscor.org>. This website will continue to be fleshed out as we develop new functionality of the next couple of years.

Data and Model Inventories

The iUTAH research teams will be developing new datasets and models to support iUTAH's research goals. However, there will also be extensive reuse of existing data resources and models from many different sources. The CI Team is developing tools that will help facilitate the process of identifying existing datasets and models that may be useful to the iUTAH efforts. For example, we are compiling a database of metadata describing existing and planned data resources. iUTAH participants can access an online metadata submission form via <http://data.iutahepscor.org> to submit metadata describing datasets that they know about. Users can also view details of datasets that have been submitted by others. The database of metadata that we compile will enable us to both prioritize efforts for providing access to specific datasets through the iUTAH Modeling and Data Federation and will serve as an initial corpus of data that we can use to develop data discovery and access services needed by iUTAH partners.

Sensor Data Management

One of the immediate goals of the iUTAH CI team is to support management of the streaming sensor data from the iUTAH aquatic and terrestrial monitoring sites that will be installed as the GAMUT network is built. The CI Team is assisting in the planning for telemetry connections to each of the iUTAH monitoring sites as well as implementing tools that will facilitate the automated loading of the streaming sensor data into relational databases where they can be more easily managed by the iUTAH watershed technicians and ultimately and shared on the Internet. Much of the required sensor data management functionality is being implemented using existing tools from the CUAHSI Hydrologic Information System.

Submit Dataset Information

Please complete this form with information about datasets that you will either be creating as part of the iUTAH project or from existing data sources. Required fields are indicated with a red star.

If you find would rather submit metadata about many datasets all at once, please download the [Microsoft Excel Template](#) and fill it out then email it to jeff.horsburgh@usu.edu or amber.jones@usu.edu and we will upload your file in bulk.

Data Inventory Submission

General Information About the Dataset

Dataset Title *

Please provide a descriptive title for the dataset.

Abstract *

Please provide a descriptive abstract.

Purpose

What is the purpose of the data? Why were they created?

Existing *

Is the data existing or is this data that will be created by iUTAH?

Submitted Datasets

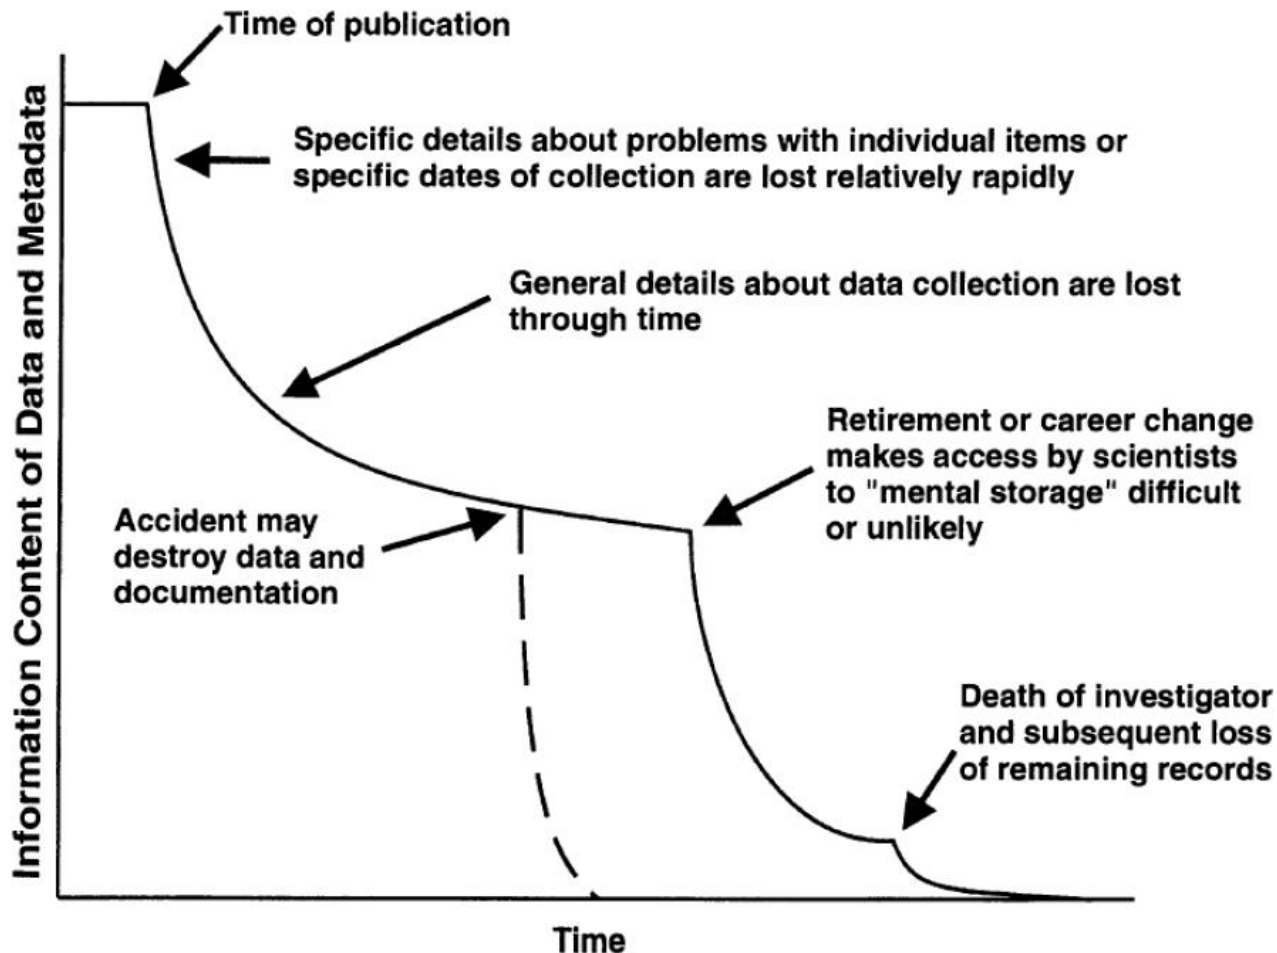

Dataset Title	Abstract	Submitter
Little Bear River, UT Continuous Water Quality Data	The Utah Water Research Laboratory uses in situ sensors to monitor water quality and streamflow at several sites in the Little Bear River. These data have been collected from 2005 to present.	Amber Jones
Utah Division of Water Rights Water Use Records	The Utah Division of Water Rights maintains records of water diversion from surface and underground sources.	Amber Jones
Airborne Thermal Infrared Remote Sensing Bear River Basin, ID/WY/UT	In 2006, Pacificorp and Trout Unlimited contracted with Watershed Sciences, Inc. to provide thermal infrared (TIR) and true color digital imagery of selected streams in the Bear River basin in Idaho, Wyoming, and Utah (Figure 1). Surveyed streams included the Bear River from Cutler Reservoir upstream to Cokeville, WY, Cub River, Thomas Fork/Salt Creek, and Smiths Fork/Hobble Creek. The data were successfully acquired from July 24–29, 2006, during the mid-afternoon hours (1:30 to 5:00 PM).	Jeff Horsburgh
State of Utah Geographic Information Database's (SGID) High Resolution Orthophotography	The Utah AGRC contracted Aero-Graphics to collect high resolution orthophotography of the Wasatch Front. Data collection occurred between March 28 and June 1 of 2012. Coverage includes 110 square miles of 12.5cm (~5 inch) resolution 4-band aerial photography imagery.	Amber Jones
Little Bear River, UT Meteorological Data	The Utah Water Research Laboratory operates four weather stations within the Little Bear River watershed. These stations have been collecting data from 2007 to present.	Amber Jones

Information Entropy

Example of the normal degradation in information content associated with data and metadata over time ("information entropy").

Michener, W.K. (2006). Meta-information concepts for ecological data management, *Ecological Informatics*, 1(1), 3-7, <http://dx.doi.org/10.1016/j.ecoinf.2005.08.004>.

What if instead?

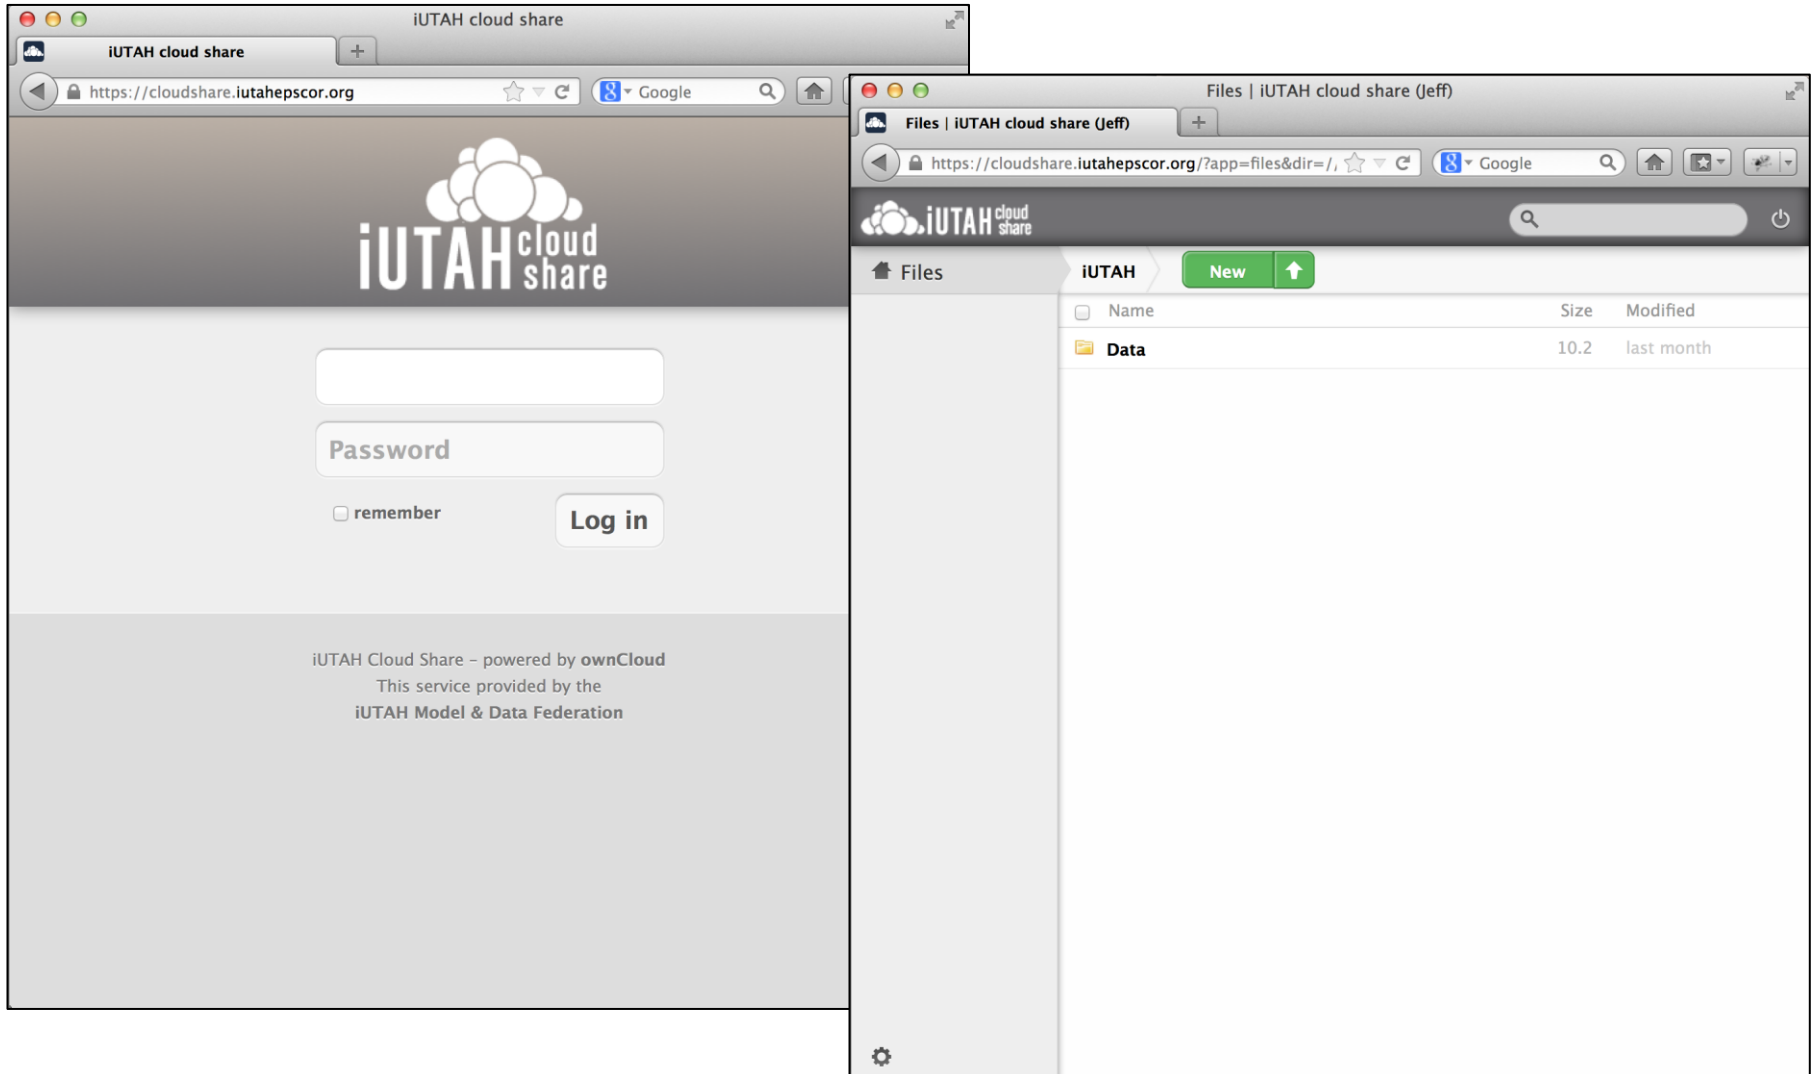

Support for Sharing and Collaboration

- Collaboration
 - Datasets as shared “social objects”
 - Formation of collaborations
 - Social networking features
- Requirements
 - What data resources are available? (metadata catalog)
 - How do I get them? (search interface)
 - How can I share what I have? (data repository)

Collaborative Data Sharing

cloudshare.iutahepscor.org

Data Publication in National Networks

- Collaboration with:
 - CUAHSI Data Center for hydrologic datasets
 - NSF DataONE Network
 - HydroShare
- Focus: publishing data products in a way that they can be cited and easily accessed

HydroShare: Collaborative Sharing of Data and Models

- Collaboration environment and social media website
 - Social objects – data, models, digital content
 - HydroShare aims to change the way we do science
 - We are working to make collaboration easier
 - Sharing data
 - Sharing models and other research products
 - Providing new communication and social media capabilities
- 5 Year, \$5 Million collaboration among USU, RENCi, BYU, Purdue, U. Texas, San Diego Supercomputer Center, Tufts, U. of North Carolina Chapel Hill, U. of South Carolina

LITTLE BEAR RIVER MONITORING SITES | Resource Details

[OPEN](#)
[SHARE](#)
[EXPORT](#)
[EDIT](#)
[DELETE](#)

Resource Type: ESRI Shapefile 

Created by: Jeff Horsburgh

Created: 6/10/2012

Keywords: observations catalog, data cart, little bear river, utah, CUAHSI, Water, Utah State University, Continuous Monitoring, Water Quality, Streamflow.

Size: 250 KB

Extent: Left: -111.95 Right: -111.79 Top: 41.73

Resource Description

Abstract: Utah State University is conducting continuous monitoring within the Little Bear River watershed of northern Utah, USA to investigate the use of surrogate measures such as turbidity in creating high frequency load estimates for constituents that cannot be measured continuously. This shapefile contains location of USU's continuous monitoring sites.

Citation: Horsburgh, J. S., D. K. Stevens, D. G. Tarboton, N. O. Mesner, A. Spackman Jones, and S. Gurrero, (2009), Monitoring data collected within the Little Bear River Experimental Watershed, Utah, USA, Utah State University.

COMMENTS

Jeff Horsburgh 11.11.12
This shapefile is really helpful if you want to know where my monitoring sites are located.

Jeff Horsburgh 11.21.12
Have you thought about re-writing the script so that it can access data using web services instead?

Next Steps

- Accessing agency and national datasets
 - Developing partnerships with data providers
- Supporting data discovery and access across iUTAH and external data sources
 - Mediating across sources, formats, semantics
- Enhanced tools for collaboration and sharing of models and data
- Data publication within national networks
 - publishing data products in a way that they can be cited and easily accessed
